LNK-LR-02C LIFERAFT LIGHT

The LNK-LR-02C Liferaft Light is a lithium battery-powered emergency light designed for installation with liferafts. Upon liferaft inflation, the “O” shape ring on the light is pulled out, activating both the exterior and interior lights automatically. The exterior light, positioned atop the liferaft, emits a flashing signal with a light intensity exceeding 4.3cd, effectively indicating the liferaft’s position for rescue. Meanwhile, the interior light provides steady illumination with a 0.5cd light intensity, suitable for basic tasks such as reading instructions. Manual switches on the light’s main body allow independent control of the external and internal lights. Notably, the light excels in low-temperature conditions, with the external light capable of working for at least 18 hours at -30℃ while maintaining a light intensity exceeding 4.3cd.
